Information on likely routes of exposure

Under workplace conditions, inhalative exposure is the main route of exposure of citric acid. Inhalative exposure is possible in the form of dust or aerosols of aqueous solutions, although the warning irritant effect means that inhalation of very high concentrations is only to be expected accidentally.

Irrespective of this, citric acid is mainly ingested orally with food. [GESTIS]

Additional toxicological information:**CAS: 77-92-9 citric acid**

(source: GESTIS)

Main toxic effects:

Acute: Irritant effect on the eyes and upper respiratory tract; no evidence of systemic toxic effects under occupationally relevant exposure conditions

chronic: irritative effects on mucous membranes and skin.

Enamel damage, dermatitis (Merck)

Further information:

Depending on the pH value, dust or concentrated aqueous solutions are highly irritating to corrosive to the eye.

11.2 Information on other hazards

Endocrine disrupting properties The product does not contain substances with endocrine disrupting properties.

Other information

According to the information available to us, the chemical, physical and toxicological properties of the substances mentioned in Chapter 3 have not been thoroughly investigated.
